- (a) This specification covers ALL frequency agile downconverters with 70MHz and/or 140MHz IF and RF input from 1.9GHz to 2.9GHz. **This table lists ONLY more common models.** Consult our office for other models configurations.
- (b) Input frequencies are an illustrative sample. Any other values from 1.9GHz to 2.9GHz, in 10MHz steps, are possible. RF coverage different from 400MHz, wider or narrower, is possible.
- (c) Other output IF and bandwidths possible.
- (d) IF output selectable via front panel and remote interface.
- (e) Three identical IF outputs, BNC, through 3-way power divider. All RF, IF and 10MHz reference connectors are square flange with 4 screw fitting

N-type square flange

BNC

- (f) Gain and compression point at each output will be reduced by 6dB when compared with a standard unit (14 to 34dB, +4dBm). Also, output return loss will be significantly reduced and cannot be guaranteed to be better than 12dB at all frequencies.

**NOTE**

All Novella's frequency converter synthesisers are of the conventional phase-locked type. No DDS techniques or ICs are used. DDS synthesisers suffer from an inherent phase uncertainty (due to the inevitable residual frequency error) rendering them unsuitable for differential phase measurements used typically in satellite ranging and monopulse tracking systems which rely on differential phase measurements between two coherent signals processed by two downlink chains.
